Tags: swim robot floating robotics learning simple hp otto

This is a **remake add-on for the HP OTTO robot** that allows it to **float and move in water** .

By printing and attaching the included **shell float parts**, the robot gains enough buoyancy to **swim in calm water** (not recommended for strong waves). The floating parts are designed to be **fully compatible with the original HP OTTO chassis**, so no modifications to the main body are required.

⚙ How it works
The design adds a **floating barrel and protective shells** that help the robot stay on the water surface while the wheels provide movement.

Assembly
Assembly is quick and simple:

1. Replace the original wheels with the provided ones.
2. Attach the **front legs** that hold the floating barrel.
3. Replace line follower sensors with plugs.

And that’s it — your robot is ready for the water!

⚠ **Note**
The **line-following sensors cannot be used** in this configuration. Instead, you must insert the **included plugs** into the sensor openings.

All required parts for the floating system and the sensor plugs are included in the files.
